

Customer Success

Industrialization of data warehousing in the financial sector from the perspective of a manager of a business intelligence competence center.

Antoine Girard, Head of Business Intelligence

I built from scratch a business intelligence service for the business I am working for.

I have experience of large business intelligence departments where any modification in the data warehouse integration stream was painful, risky, and involved a lot resources.

I was also looking forward a tool that would ease the documentation process and would bring me a homogeneous integration process by design. AnalyticsCreator answer that need and makes it reliable and accessible.

We started working with AC in mid-2020, without any experience of the tool, but with data warehousing skills in SQL server and SSIS. We delivered our first fact table a month later, and 1 year and a half later, we are two people maintaining a 800-objects data warehouse.

The tool requires prior experience in data warehousing, SQL server and SSIS. There is a deployment feature, but we also manage to easily set up a CI/CD though Azure Devops.

AnalyticsCreator is a very efficient product which I would recommend to any SME having plans to industrialize its data warehousing and business intelligence service efficiently.
